Vendor:Microsoft

Exam Code:70-642

Exam Name:TS: Windows Server 2008 Network
Infrastructure

Version:Demo

QUESTION 1

Your network contains a server named Server1 that runs Windows Server 2008 R2 Service Pack (SP1).

All users have laptops that run Windows 7. The users frequently work from network locations that only allow outbound communication to the Internet by using HTTP and HTTPS.

You plan to configure Server1 as a VPN server.

You need to identify which VPN protocol you should use to ensure that all of the users can establish VPN connections to Server1.

Which VPN protocol should you identify?

- A. PPTP
- B. SSTP
- C. L2TP
- D. IKEv2

Correct Answer: B

QUESTION 2

Your network contains a domain controller named DC1 and a member server named Server1. You save a copy of the Active Directory Web Services (ADWS) event log on DC1. You copy the log to Server1.

You open the event log file on Server1 and discover that the event description information is unavailable. You need to ensure that the event log file displays the same information when the file is open on Server1 and on DC1.

What should you do on Server1?

- A. Import a custom view.
- B. Copy the SYSVOL folder from DC1.
- C. Copy the LocaleMetaData folder from DC1.
- D. Create a custom view.

Correct Answer: C

The LocaleMetaData contains the description/display information that is missing, and when you "save all events as" you should chose to save and "display information". <http://technet.microsoft.com/en-us/library/cc749339.aspx>

QUESTION 3

Your network contains an Active Directory domain. The domain contains a server named Server1 that runs Windows Server 2008 R2.

Server1 contains a folder named Folder1. A domain user named User1 does not have NTFS Read permission for Folder1.

You need User1 to create a backup copy of Folder1. User1 must NOT be able to restore the backup copy on Server1. What should you do?

To answer, move the appropriate actions from the Possible Actions list to the Necessary Actions area and arrange them in the correct order.

Select and Place:

Possible Actions	Necessary Actions
Add User1 to the Backup Operators group on Server1.	
Add User1 to the Backup Operators group in the domain.	
Assign the Backup files and directories user right to User1.	
Instruct User1 to restart the Protected Storage service.	
Instruct User1 to create a copy of Folder1 by using Xcopy.	
Instruct User1 to log off of Server1, and then to log back on to Server1.	
Instruct User1 to create a shadow copy of Folder1 by using Windows Explorer.	
Instruct User1 to create a backup of Folder 1 by using Windows Server Backup.	

Correct Answer:

Possible Actions	Necessary Actions
Add User1 to the Backup Operators group on Server1.	Assign the Backup files and directories user right to User1.
Add User1 to the Backup Operators group in the domain.	Instruct User1 to log off of Server1, and then to log back on to Server1.
	Instruct User1 to create a backup of Folder 1 by using Windows Server Backup.
Instruct User1 to restart the Protected Storage service.	
Instruct User1 to create a copy of Folder1 by using Xcopy.	
Instruct User1 to create a shadow copy of Folder1 by using Windows Explorer.	

This user right determines which users can bypass file and directory, registry, and other persistent object permissions for the purposes of backing up the system. Specifically, this user right is similar to granting the following permissions to the user or group in Question on all files and folders on the system: Traverse Folder/Execute File List Folder/Read Data Read Attributes Read Extended Attributes Read Permissions [http://technet.microsoft.com/en-us/library/cc787956\(v=ws.10\).aspx](http://technet.microsoft.com/en-us/library/cc787956(v=ws.10).aspx)

QUESTION 4

Your network contains a file server named Server1 that runs Windows Server 2008 R2.

You have several UNIX-based client computers on the network.

Users report that they cannot access shared folders on Server1 from the UNIX-based client computers.

You need to ensure that users can access the shared folders on Server1.

What should you install on Server1?

- A. Network Policy Server (NPS)
- B. Services for Network File System (NFS)
- C. Simple TCP/IP Services
- D. File Server Resource Manager (FSRM)

Correct Answer: B

Services for Network File System (NFS) provides a file-sharing solution for enterprises that have a mixed Windows and UNIX environment. Services for NFS enables users to transfer files between computers running the Windows Server?

2008 operating system and UNIX-based computers using the NFS protocol.

[http://technet.microsoft.com/en-us/library/cc753302\(v=ws.10\).aspx](http://technet.microsoft.com/en-us/library/cc753302(v=ws.10).aspx)

QUESTION 5

Your company has a server named FS1. FS1 hosts the domain-based DFS namespace named \\contoso.com\dfs. All domain users store their data in subfolders within the DFS namespace.

You need to prevent all users, except administrators, from creating new folders or new files at the root of the \\contoso.com\dfs share.

What should you do?

- A. Run the `dfscmd.exe \\FS1\dfs /restore` command on FS1.
- B. Configure the NTFS permissions for the `C:\DFSroots\dfs` folder on FS1. Set the Create folders/append data special permission to Deny for the Authenticated Users group. Set the Full Control permission to Allow for the Administrators group.
- C. Start the Delegate Management Permissions Wizard for the DFS namespace named \\contoso.com\dfs. Remove all groups that have the permission type Explicit except the Administrators group.
- D. Configure the \\FS1\dfs shared folder permissions. Set the permissions for the Authenticated Users group to Reader. Set the permissions for the Administrators group to Co-owner.

Correct Answer: D

QUESTION 6

Your network contains an Active Directory domain. All domain controllers run Windows Server 2008 R2.

The domain contains three domain controllers named DC1, DC2, and DC3. All of the domain controllers have the DNS server role installed.

You create a new Active Directory-integrated DNS zone on DC1. You need to ensure that the zone is only replicated to DC1 and DC3. The solution must ensure that all zone replication traffic is encrypted.

What should you do?

To answer, move the appropriate actions from the Possible Actions list to the Necessary Actions area and arrange them in the correct order.

Select and Place:

Possible Actions	Necessary Actions
Change the zone type.	
Create a primary zone.	
Create a secondary zone.	
Modify the zone transfer settings.	
Change the zone replication scope.	
Create an application directory partition.	
Add a replica to the application directory partition.	

Correct Answer:

Possible Actions	Necessary Actions
Change the zone type.	Create an application directory partition.
Create a primary zone.	Change the zone replication scope.
Create a secondary zone.	Add a replica to the application directory partition.
Modify the zone transfer settings.	

QUESTION 7

Your network contains an Active Directory forest. The forest contains a member server named Server1 that runs Windows Server 2008 R2. You need to ensure that UNIX-based client computers can access shared folders on Server1.

Which server role, role service, or feature should you install?

- A. Windows Server Update Services (WSUS)
- B. Network Policy Server (NPS)
- C. Routing and Remote Access service (RRAS)
- D. Simple TCP/IP Services
- E. Windows System Resource Manager (WSRM)
- F. File Server Resource Manager (FSRM)
- G. Wireless LAN Service
- H. Network Load Balancing (NLB)
- I. Windows Internal Database
- J. Services for Network File System (NFS)
- K. Group Policy Management
- L. Health Registration Authority (HRA)
- M. Connection Manager Administration Kit (CMAK)

Correct Answer: J

[http://technet.microsoft.com/en-us/library/cc753302\(v=ws.10\).aspx](http://technet.microsoft.com/en-us/library/cc753302(v=ws.10).aspx) Services for Network File System (NFS) provides a file-sharing solution for enterprises that have a mixed

Windows and UNIX environment. Services for NFS enables users to transfer files between computers running the Windows Server 2008 operating system and UNIX-based computers using the NFS protocol.

QUESTION 8

Your network contains an Active Directory domain.

Your company is implementing Network Access Protection (NAP). You need to define which network resources non-compliant client computers can access.

What should you configure?

- A. the Windows Authentication authentication provider

- B. remediation server groups
- C. the RADIUS Accounting accounting provider
- D. system health validators (SHVs)
- E. IKEv2 client connections
- F. the Windows Accounting accounting provider
- G. the RADIUS Authentication authentication provider
- H. Group Policy preferences
- I. health policies
- J. connection request policies

Correct Answer: B

Remediation server groups - Are used to specify servers that are available to noncompliant NAP clients for the purpose of remediating their health state to comply with health requirements. The type of remediation servers that are required depend on your health requirements and network access methods. After you create a remediation server group, you must add this group to a network policy for noncompliant computers. [http://technet.microsoft.com/en-us/library/dd125372\(v=ws.10\).aspx](http://technet.microsoft.com/en-us/library/dd125372(v=ws.10).aspx)

QUESTION 9

Your company has four DNS servers that run Windows Server 2008 R2. Each server has a static IP address. You need to prevent DHCP from assigning the addresses of the DNS servers to DHCP clients. What should you do?

- A. Create a new scope for the DNS servers.
- B. Create a reservation for the DHCP server.
- C. Configure the 005Name Servers scope option.
- D. Configure an exclusion that contains the IP addresses of the four DNS servers.

Correct Answer: D

QUESTION 10

Your network contains an Active Directory domain. The domain contains a print server named Server1. Server1 runs Windows Server 2008 R2.

You need to ensure that users can locate all shared printers on Server1 by using Active Directory. What should you do from Server1?

- A. Run the pubprn.vbs script.
- B. Run dism.exe.

- C. Run the Set-ADObject cmdlet.
- D. Modify the Print Server properties.

Correct Answer: A

The script pubprn.vbs publishes a printer to the Active Directory Domain Services.

QUESTION 11

Your company has a domain controller that runs Windows Server 2008 R2 and the DNS role. The DNS domain is named contoso.com.

You need to ensure that inquiries about contoso.com are sent to dnsadmin@contoso.com. What should you do?

- A. Create a Signature (SIG) record for the domain controller.
- B. Modify the Name Server (NS) record for the domain controller.
- C. Modify the Service Location (SRV) record for the domain controller.
- D. Modify the Start of Authority (SOA) record on the domain controller.

Correct Answer: D

QUESTION 12

Your network contains two servers named Server1 and Server2 that run a Server Core installation of Windows Server 2008 R2. Server1 has the SNMP Service installed.

You need to ensure that Server2 can send SNMP traps to Server1.

What should you do?

- A. On Server2, run `dism /online /enable-feature /featurename:snmp-sc`.
- B. On Server1, run `oclistsnmp-sc`.
- C. On Server2, run `oclistsnmp-sc`.
- D. On Server1, run `dism /online /enable-feature /featurename:snmp-sc`.

Correct Answer: A

To install a feature:

`Dism /online /enable-feature /featurename:`

To remove a feature

`Dism /online /disable-feature /featurename:`

[http://technet.microsoft.com/pt-br/library/ee441253\(v=ws.10\).aspx](http://technet.microsoft.com/pt-br/library/ee441253(v=ws.10).aspx)
